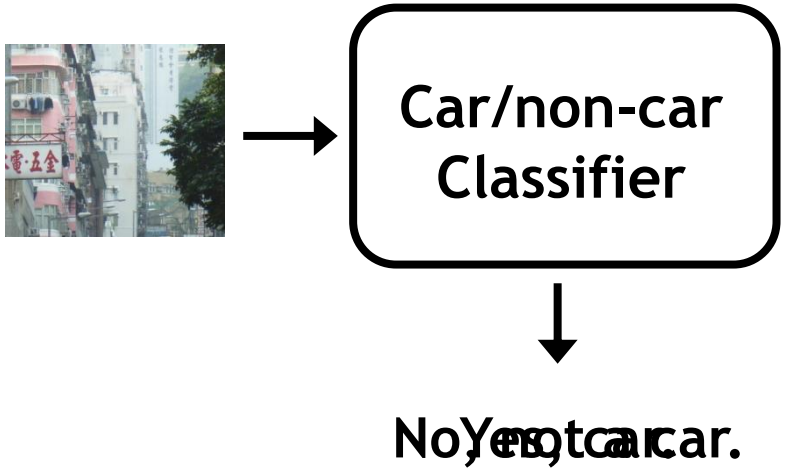
Object detection: basic framework

- Build/train object model
- Generate candidate regions in new image
- Score the candidates

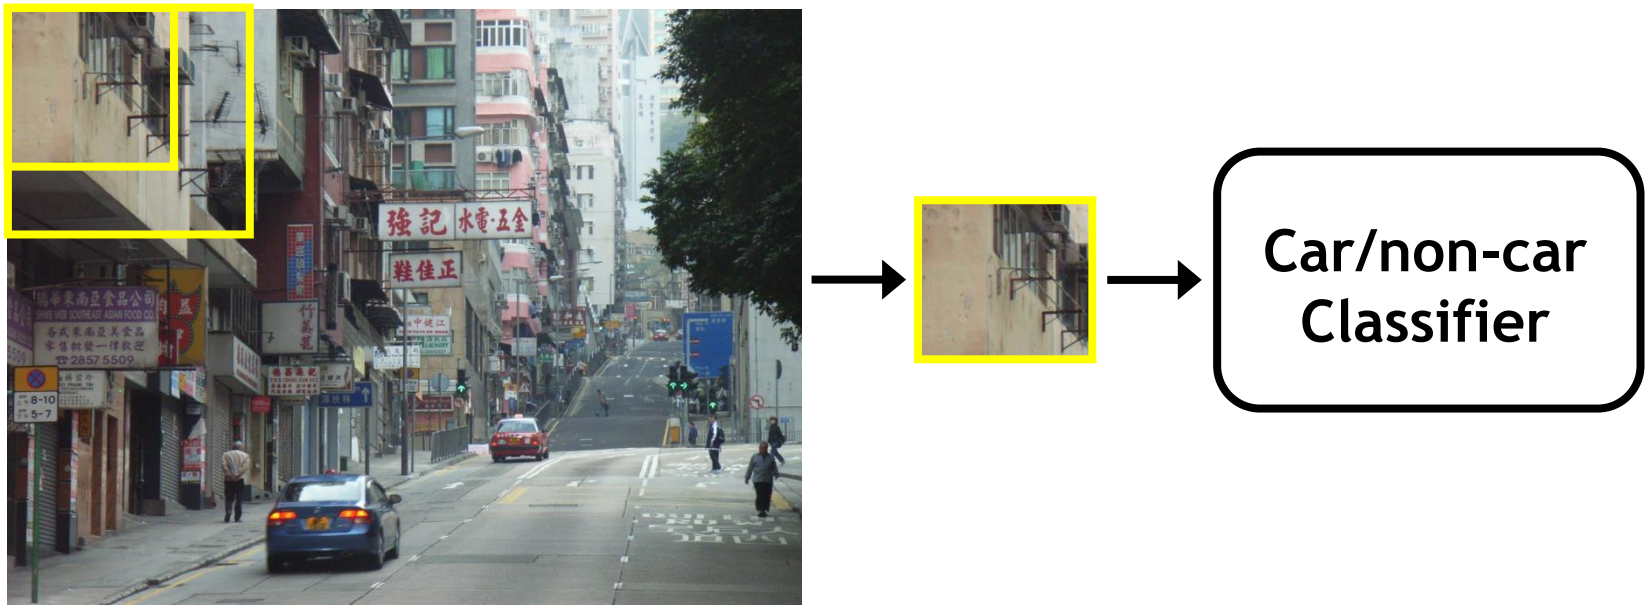
Adapted from Kristen Grauman

Window-template-based models
Building an object model

Given the representation, train a binary classifier



Window-template-based models
Generating and scoring candidates



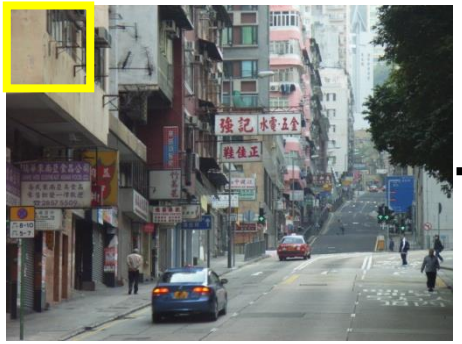
Window-template-based object detection: recap

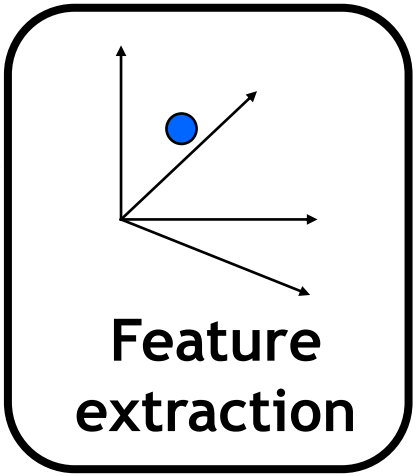
Training:

1. Obtain training data
2. Define features
3. Define classifier

Given new image:

1. Slide window
2. Score by classifier



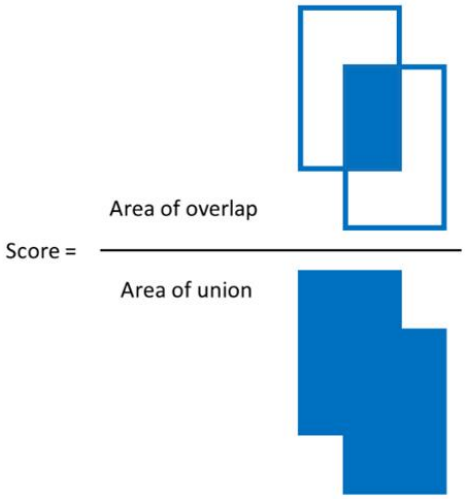


Car/non-car
Classifier

Evaluating detection methods

$$mAP = \frac{1}{|classes|} \sum_{c \in classes} \frac{\#TP(c)}{\#TP(c) + \#FP(c)}$$

- True Positive - TP(c): a predicted bounding box (pred_bb) was made for class c, there is a ground truth bounding box (gt_bb) of class c, and IoU(pred_bb, gt_bb) >= 0.5.
- False Positive - FP(c): a pred_bb was made for class c, and there is no gt_bb of class c. Or there is a gt_bb of class c, but IoU(pred_bb, gt_bb) < 0.5.



Dalal-Triggs pedestrian detector

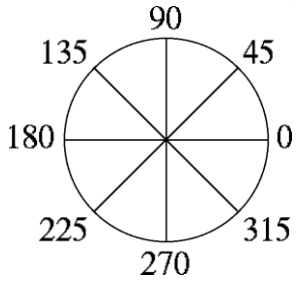
1. Extract fixed-sized (64x128 pixel) window at multiple positions and scales
2. Compute HOG (histogram of gradient) features within each window
3. Score the window with a linear SVM classifier
4. Perform non-maxima suppression to remove overlapping detections with lower scores

Navneet Dalal and Bill Triggs, Histograms of Oriented Gradients for Human Detection, CVPR05

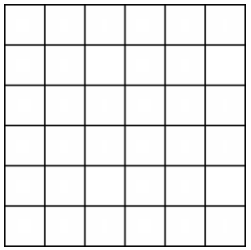
Histograms of oriented gradients (HOG)

Divide image into 8x8 regions

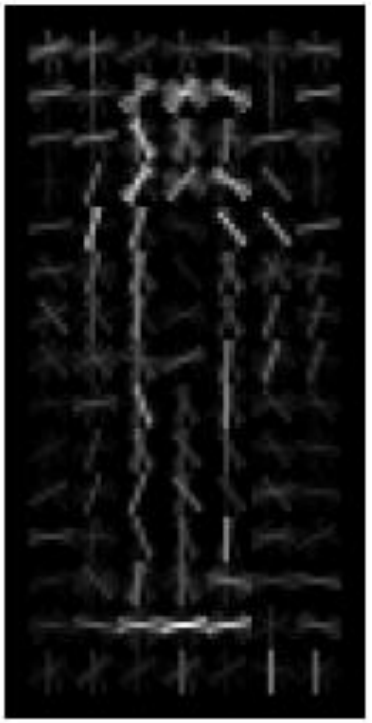
Orientation: 9 bins
(for unsigned angles)



Histograms in
8x8 pixel cells



Votes weighted by magnitude



Adapted from Pete Barnum

Navneet Dalal and Bill Triggs, Histograms of Oriented Gradients for Human Detection, CVPR05

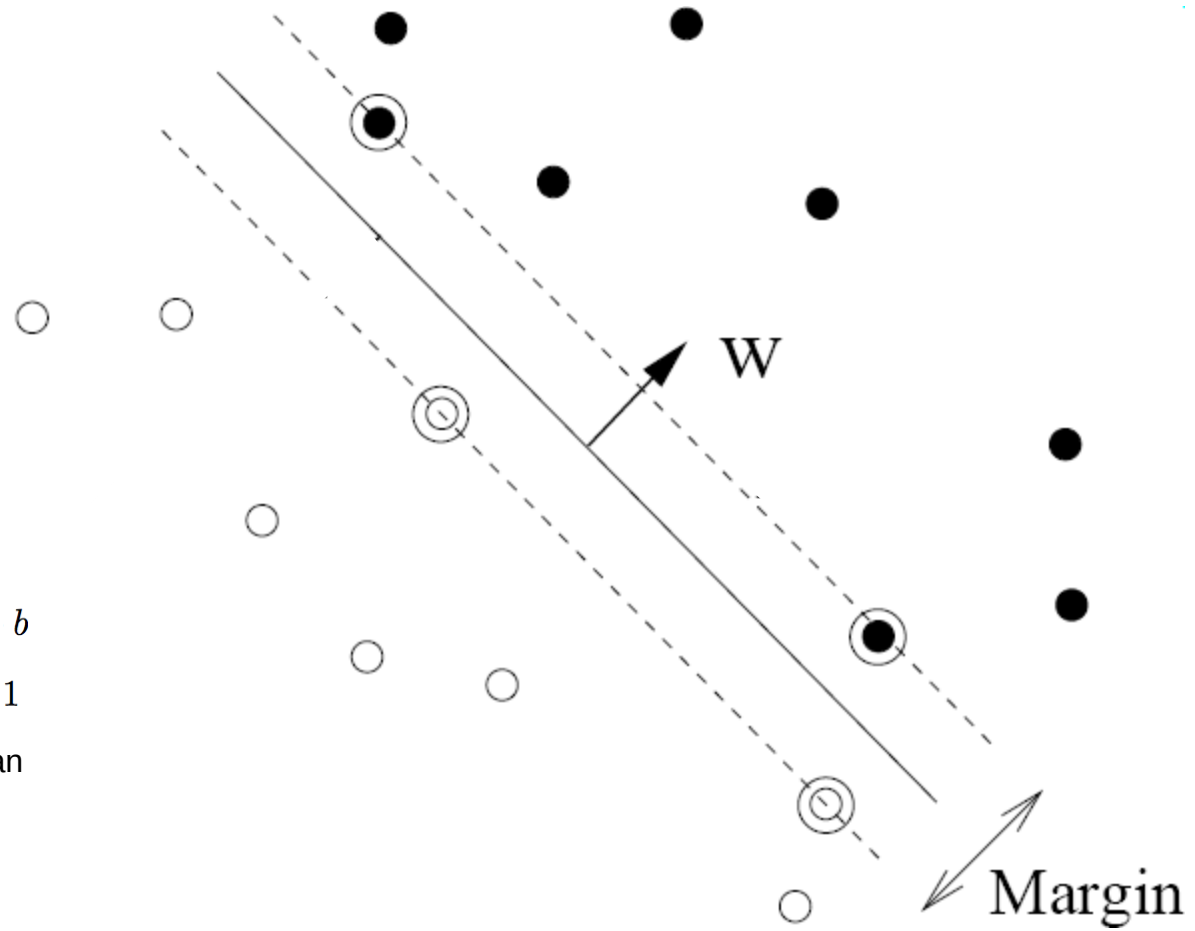
Train SVM for pedestrian detection using HoG

pos w

$0.16 = w^T x + b$

$sign(0.16) = 1$

=> pedestrian

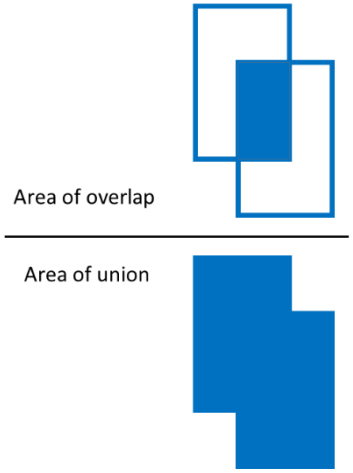


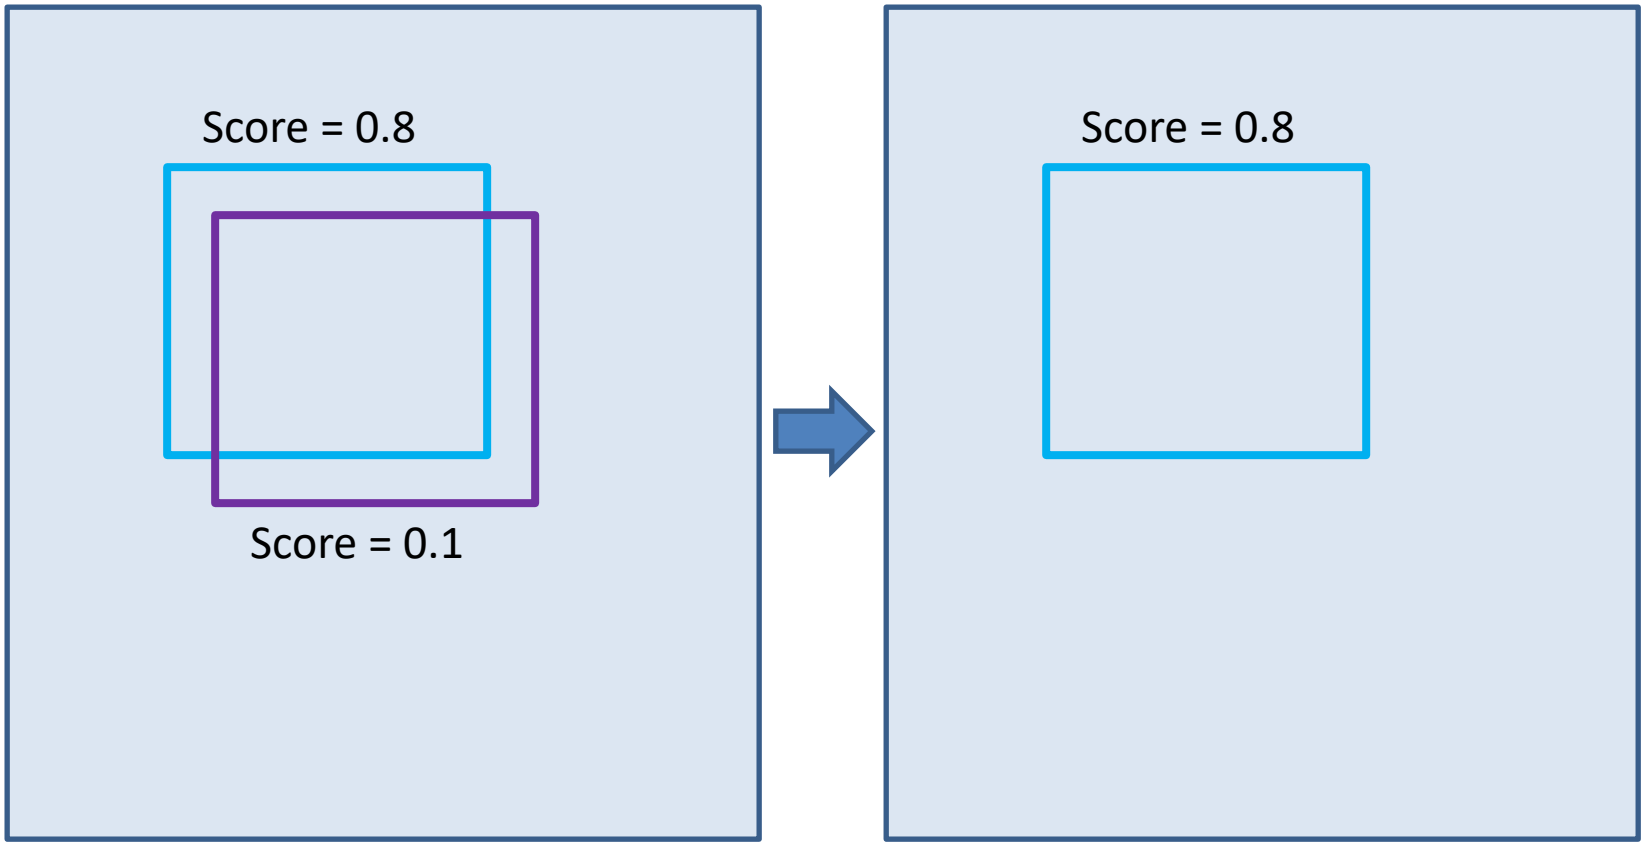
Adapted from Pete Barnum

Navneet Dalal and Bill Triggs, Histograms of Oriented Gradients for Human Detection, CVPR05

Remove overlapping detections

Non-max suppression





Adapted from Derek Hoiem

Are window templates enough?

- Many objects are articulated, or have parts that can vary in configuration

Images from Caltech-256, D. Ramanan

- Many object categories look very different from different viewpoints, or from instance to instance

Adapted from N. Snavely, D. Tran

Parts-based Models

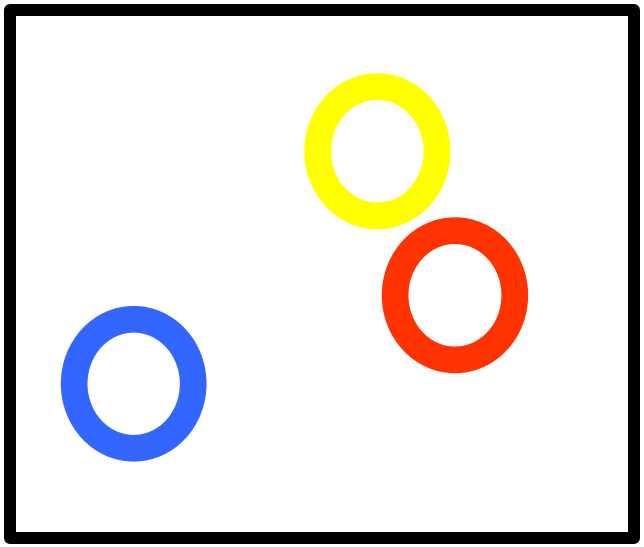
Define object by collection of parts modeled by

1. Appearance
2. Spatial configuration

Slide credit: Rob Fergus

How to model spatial relations?

- One extreme: fixed template



Fixed part-based template

- Object model = sum of scores of features at fixed positions

+3 +2 -2 -1 -2.5 = -0.5 ? > 7.5

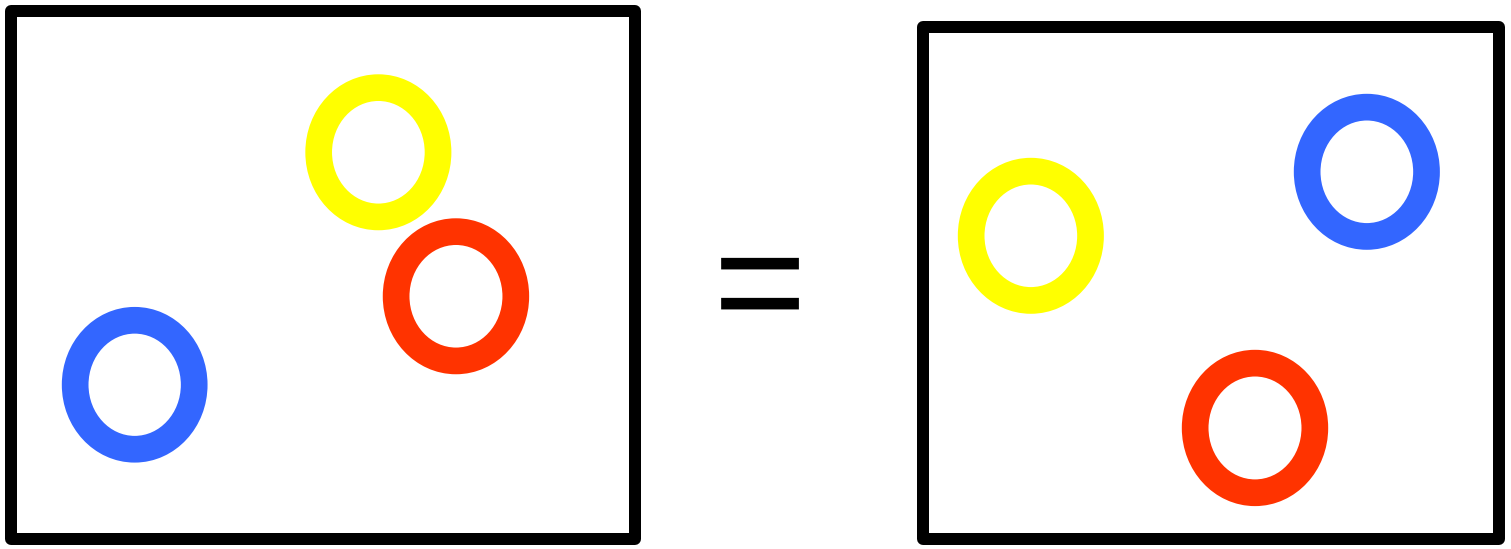
Non-object

+4 +1 +0.5 +3 +0.5 = 10.5 ? > 7.5

Object

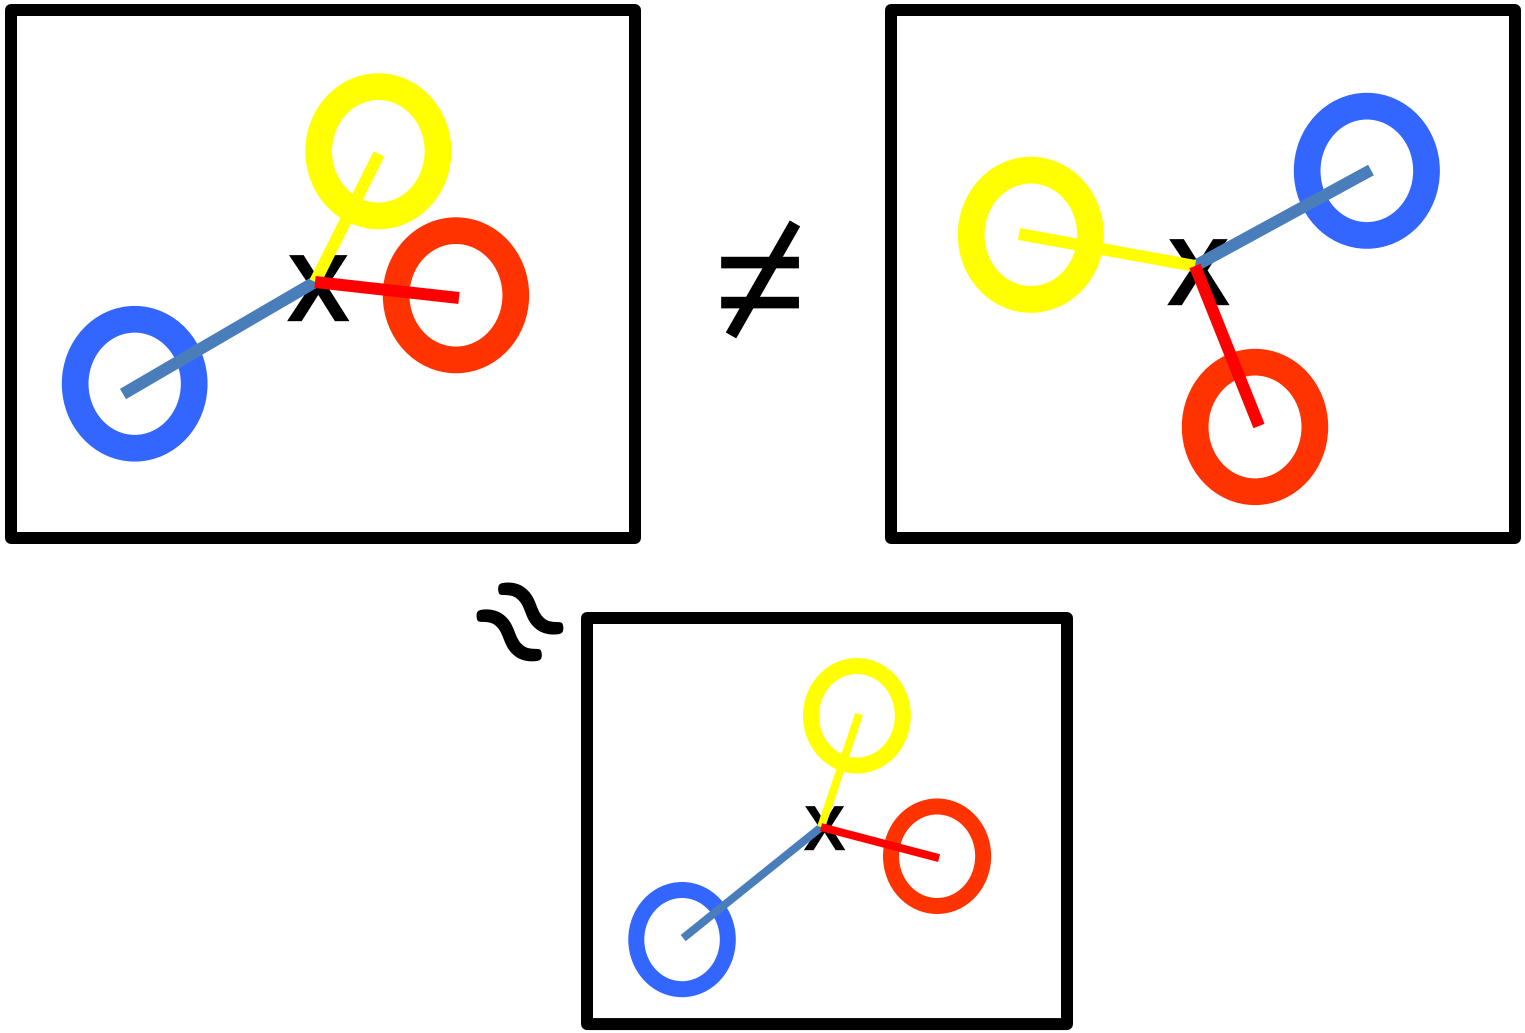
How to model spatial relations?

- Another extreme: bag of words



How to model spatial relations?

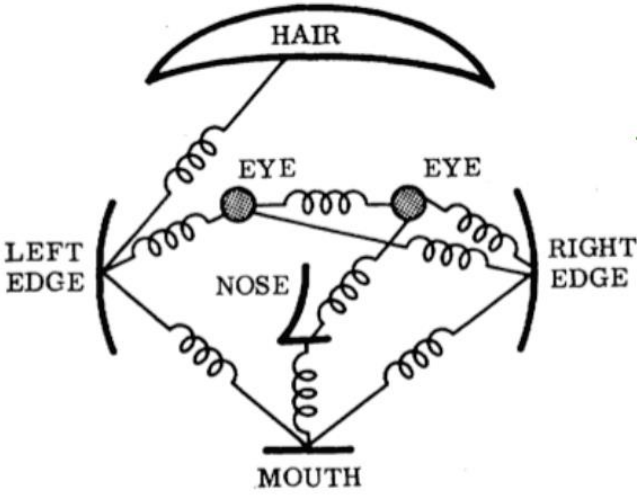
- Star-shaped model

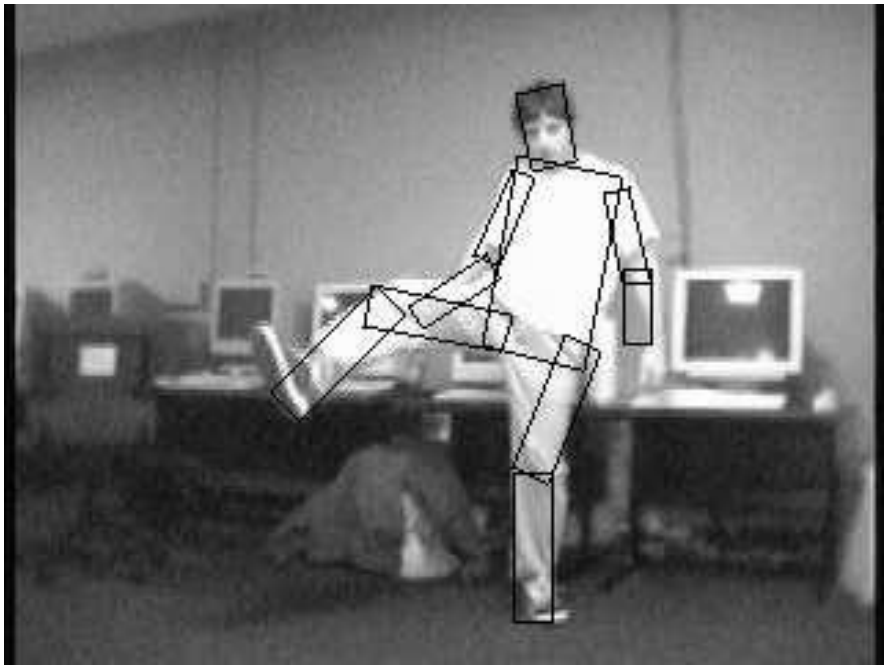


Derek Hoiem

Parts-based Models

- Articulated parts model
  - Object is configuration of parts
  - Each part is detectable and can move around





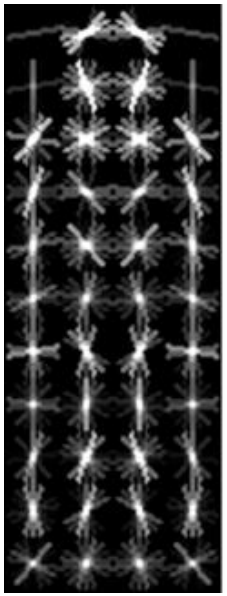
Adapted from Derek Hoiem, images from Felzenszwalb

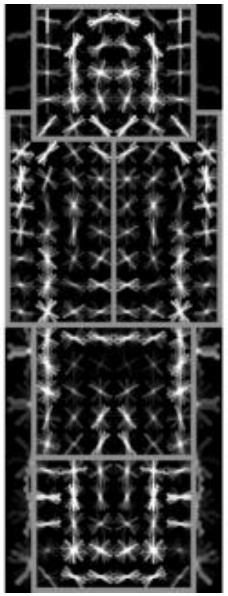
Deformable Part Models

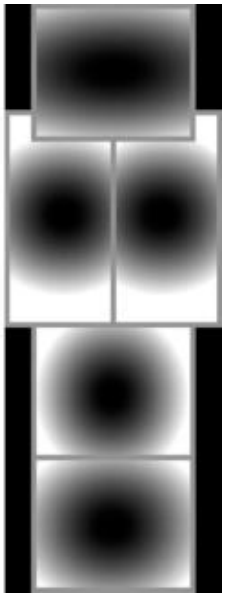
Root filter

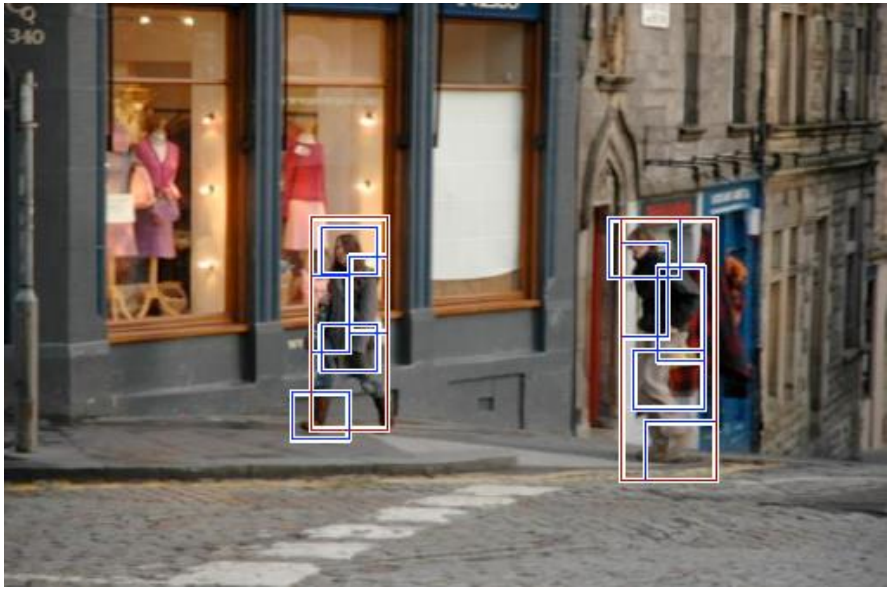
Part filters

Deformation weights









P. Felzenszwalb, R. Girshick, D. McAllester, D. Ramanan, Object Detection with Discriminatively Trained Part Based Models, PAMI 32(9), 2010

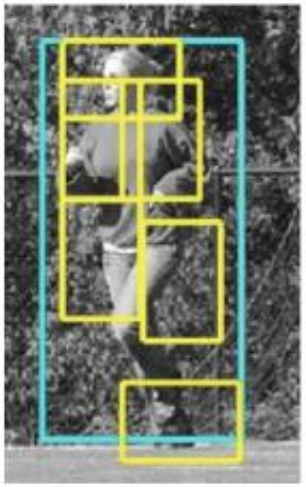
Scoring an object hypothesis

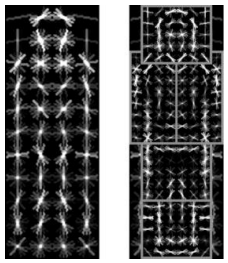
- The score of a hypothesis is the sum of appearance scores minus the sum of deformation costs

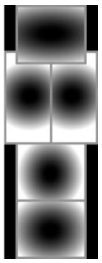
$$z = (p_0, \ldots, p_n)$$

p_0 : location of root

$p_1, \ldots, p_n$: location of parts







part loc (where we see part) — anchor loc (where we *expect* to see part)

$$(dx_i, dy_i) = \overbrace{(x_i, y_i)}^{\text{part loc}} - \overbrace{(2(x_0, y_0) + v_i)}^{\text{anchor loc}}$$

Displacements

i.e. how much the part p_i moved from its expected anchor location in the x, y directions

$$\text{score}(p_0, \ldots, p_n) = \sum_{i=0}^{n} F_i' \cdot \phi(H, p_i) - \sum_{i=1}^{n} d_i \cdot \phi_d(dx_i, dy_i) + b$$

Appearance weights

Part features

Deformation weights

i.e. how much we'll penalize the part p_i for moving from its expected location

Felzenszwalb et al.

Detection

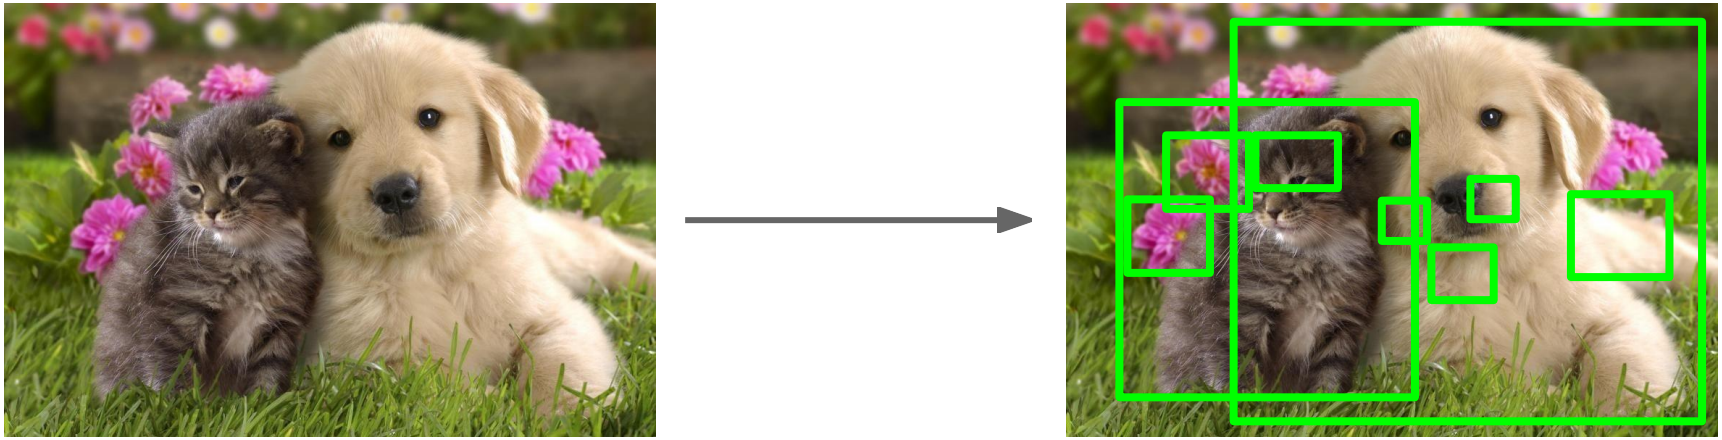
Problem: Need to apply CNN to huge number of locations and scales, very computationally expensive!

Slide by: Justin Johnson

Region Proposals

- Find “blobby” image regions that are likely to contain objects
- Relatively fast to run; e.g. Selective Search gives 1000 region proposals in a few seconds on CPU



Alexe et al, “Measuring the objectness of image windows”, TPAMI 2012
Uijlings et al, “Selective Search for Object Recognition”, IJCV 2013
Cheng et al, “BING: Binarized normed gradients for objectness estimation at 300fps”, CVPR 2014
Zitnick and Dollar, “Edge boxes: Locating object proposals from edges”, ECCV 2014

Slide by: Justin Johnson

Speeding up detection: Restrict set of windows we pass through SVM to those w/ high "objectness"

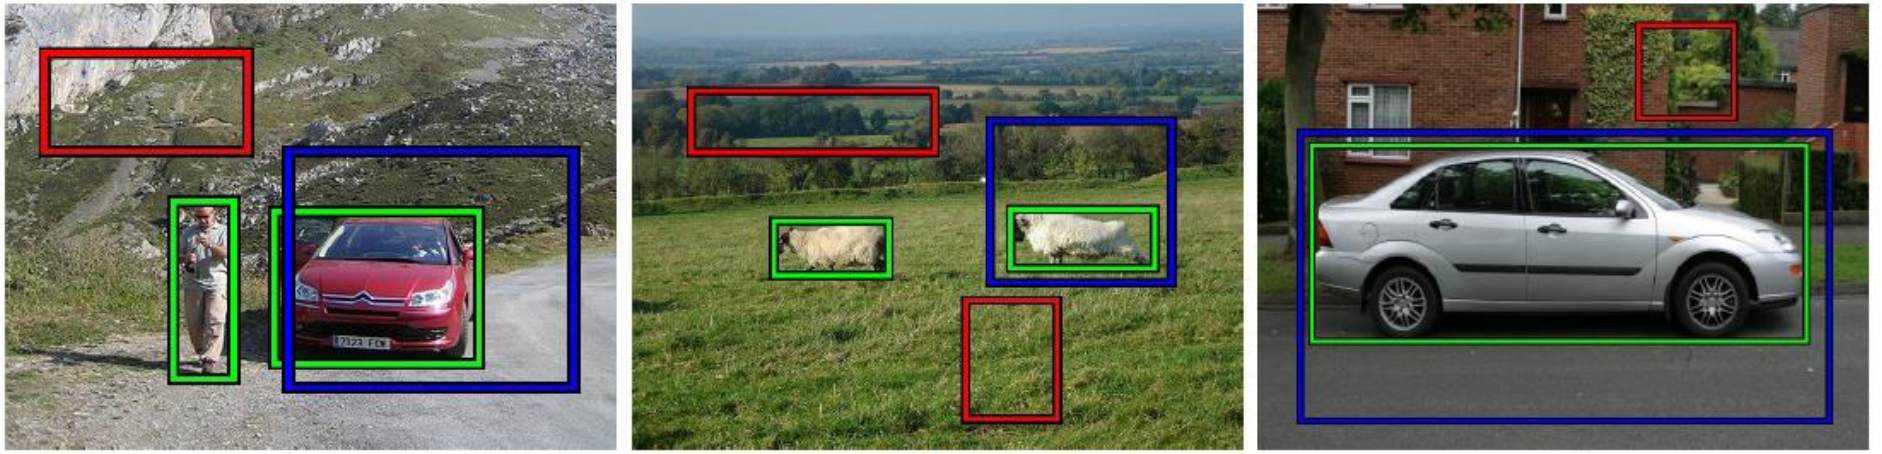


Fig. 1: **Desired behavior of an objectness measure.** *The desired objectness measure should score the blue windows, partially covering the objects, lower than the ground truth windows (green), and score even lower the red windows containing only stuff or small parts of objects.*

Alexe et al., CVPR 2010

Objectness cue #1: Where people look

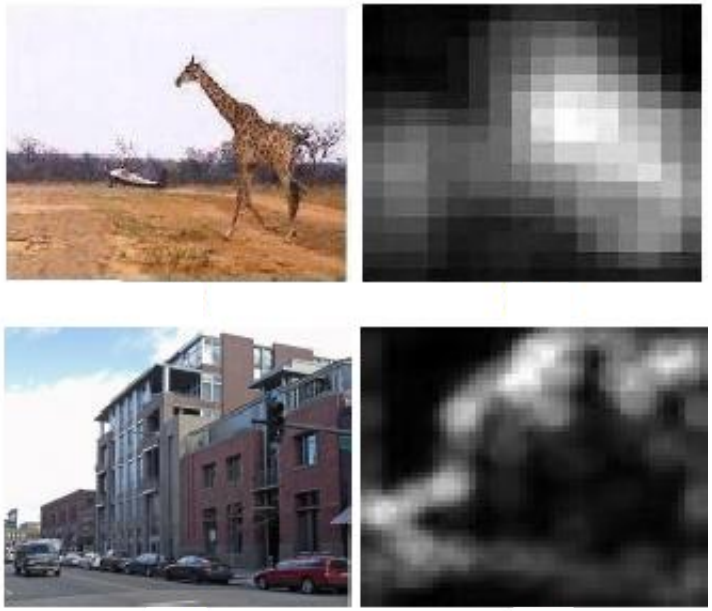

Fig. 2: **MS success and failure.**

Alexe et al., CVPR 2010

Objectness cue #2: color contrast at boundary

(a) (b) (c)

Fig. 3: **CC success and failure. Success:** *the windows containing the objects (cyan) have high color contrast with their surrounding ring (yellow) in images (a) and (b).* **Failure:** *the color contrast for windows in cyan in image (c) is much lower.*

Alexe et al., CVPR 2010

Objectness cue #3:
no segments “straddling” the object box

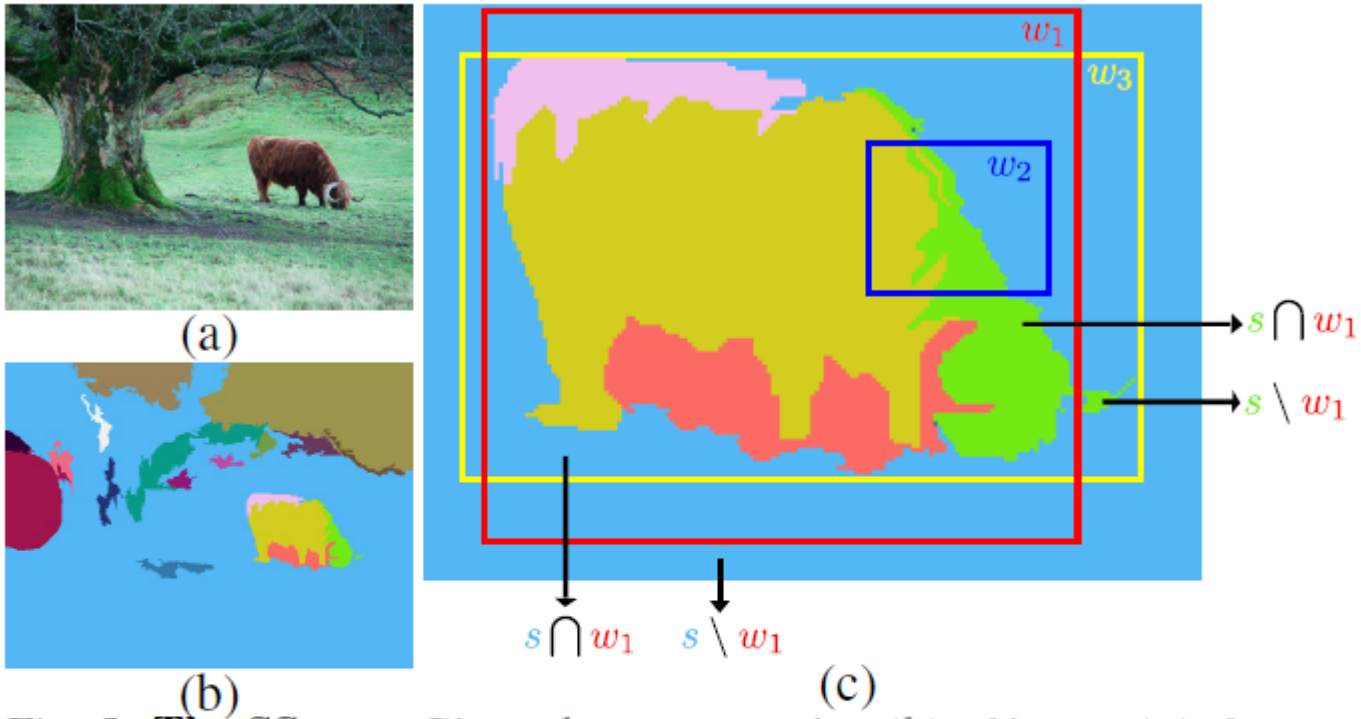

Fig. 5: **The SS cue.** *Given the segmentation (b) of image (a), for a window w we compute $\mathrm{SS}(\mathrm{w}, \theta_{\mathrm{SS}})$ (eq. 4). In (c), most of the surface of w_1 is covered by superpixels contained almost entirely inside it. Instead, all superpixels passing by w_2 continue largely outside it. Therefore, w_1 has a higher SS score than w_2. The window w_3 has an even higher score as it fits the object tightly.*

Alexe et al., CVPR 2010

R-CNN

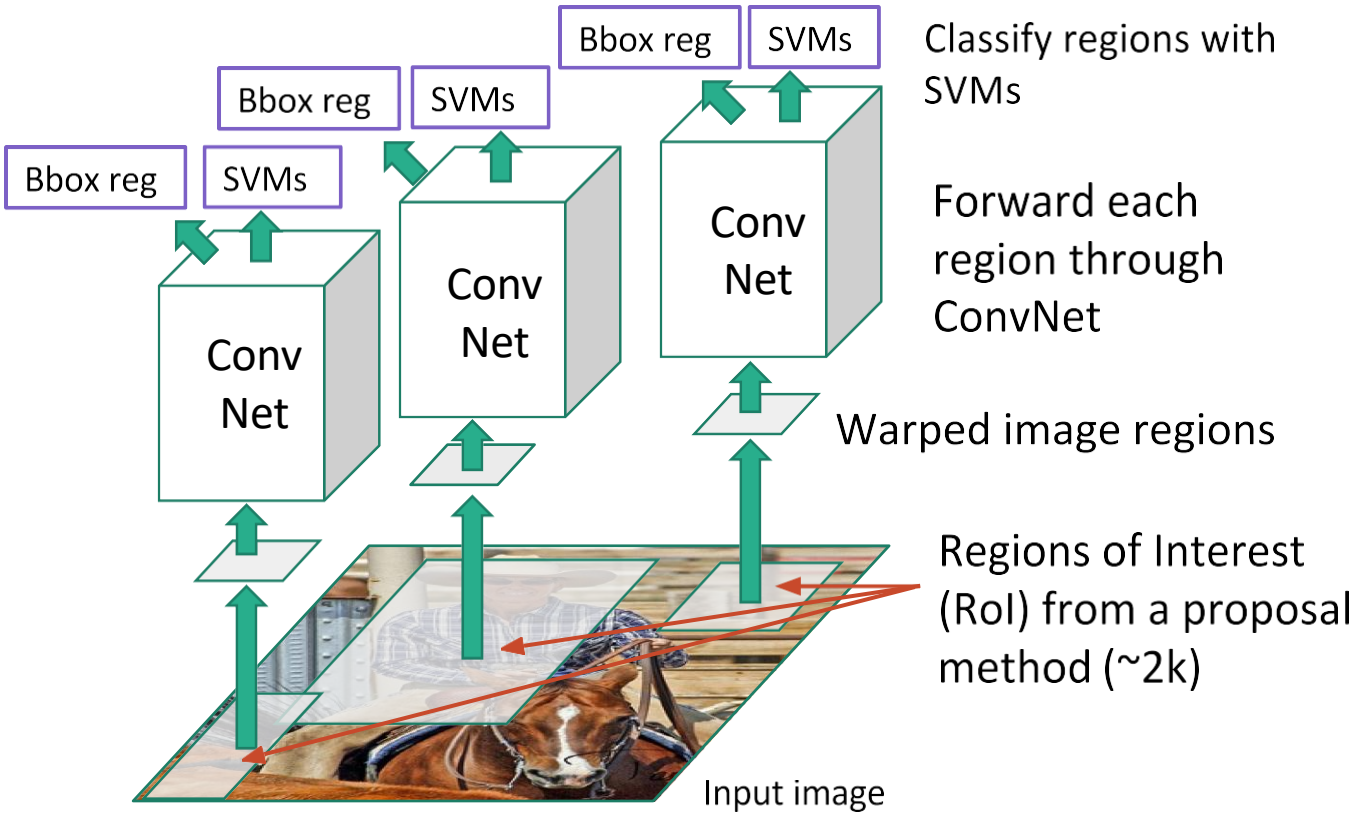
Linear Regression for bounding box offsets



Classify regions with SVMs

Forward each region through ConvNet

Warped image regions

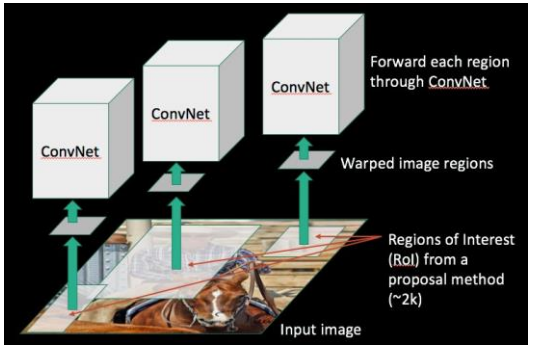
Regions of Interest (RoI) from a proposal method (~2k)

Post hoc component

Girshick et al., "Rich Feature Hierarchies for Accurate Object Detection and Semantic Segmentation", CVPR 2014

What's wrong with slow R-CNN?

- Ad-hoc training objectives
  - Train post-hoc linear SVMs (hinge loss)
  - Train post-hoc bounding-box regressions (L2 loss)
- Training is slow (84h), takes a lot of disk space
  - Need to store all region crops
- Inference (detection) is slow
  - 47s / image with VGG16 [Simonyan & Zisserman, ICLR15]



~2000 ConvNet forward passes per image

Adapted from Girshick, "Fast R-CNN", ICCV 2015

Fast R-CNN

- One network, applied one time, not 2000 times
- Trained end-to-end (in one stage)
- Fast test time
- Higher mean average precision

Adapted from Girshick, "Fast R-CNN", ICCV 2015

Fast R-CNN

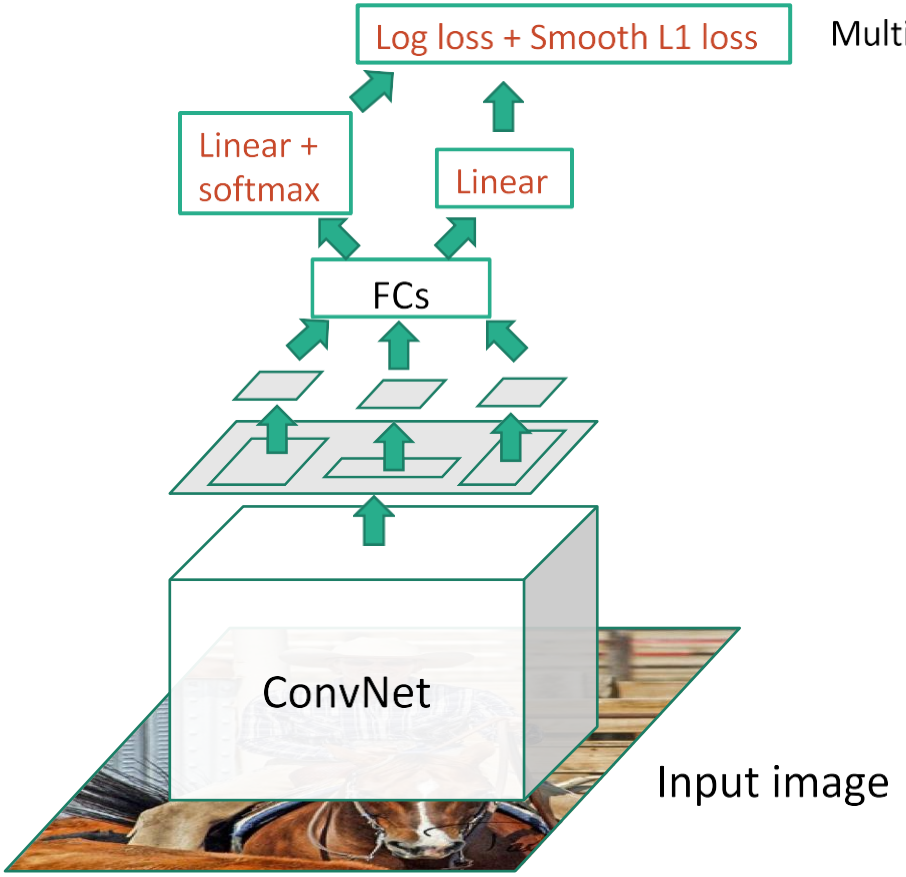
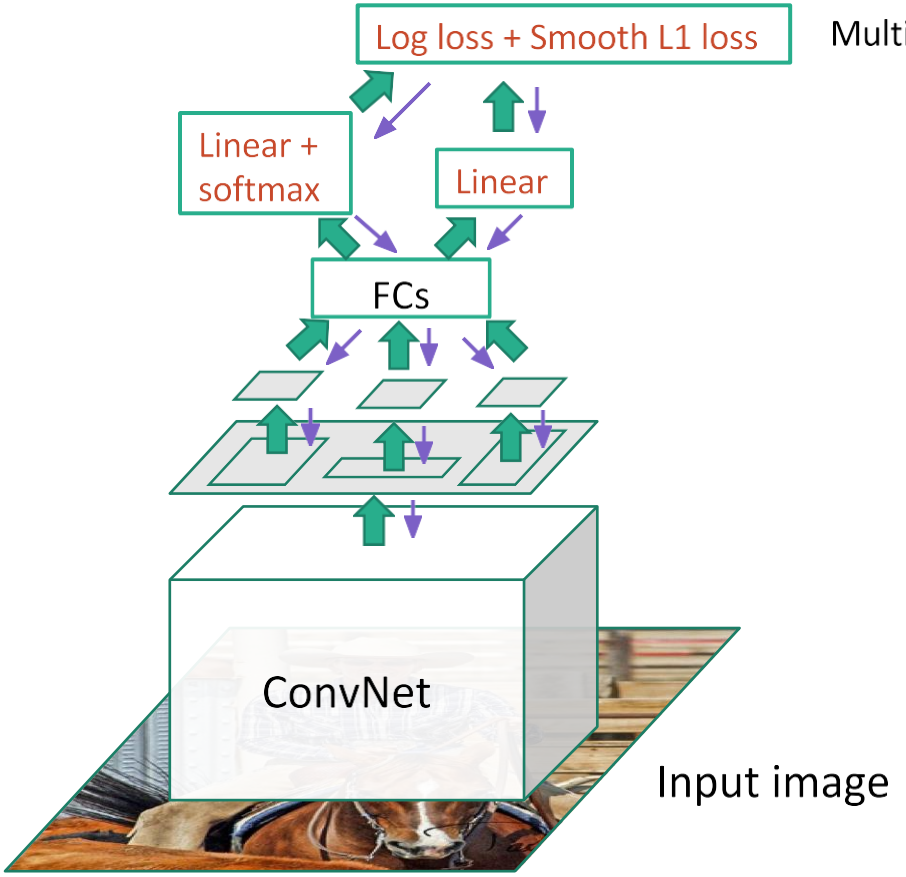
Fast R-CNN (Training)



Girshick, "Fast R-CNN", ICCV 2015

Fast R-CNN (Training)



Girshick, "Fast R-CNN", ICCV 2015

Fast R-CNN vs R-CNN

	Fast R-CNN	R-CNN
Train time (h)	9.5	84
Speedup	8.8x	1x
Test time / image	0.32s	47.0s
Test speedup	146x	1x
mAP	66.9%	66.0%

Timings exclude object proposal time, which is equal for all methods.
All methods use VGG16 from Simonyan and Zisserman.

Girshick, "Fast R-CNN", ICCV 2015

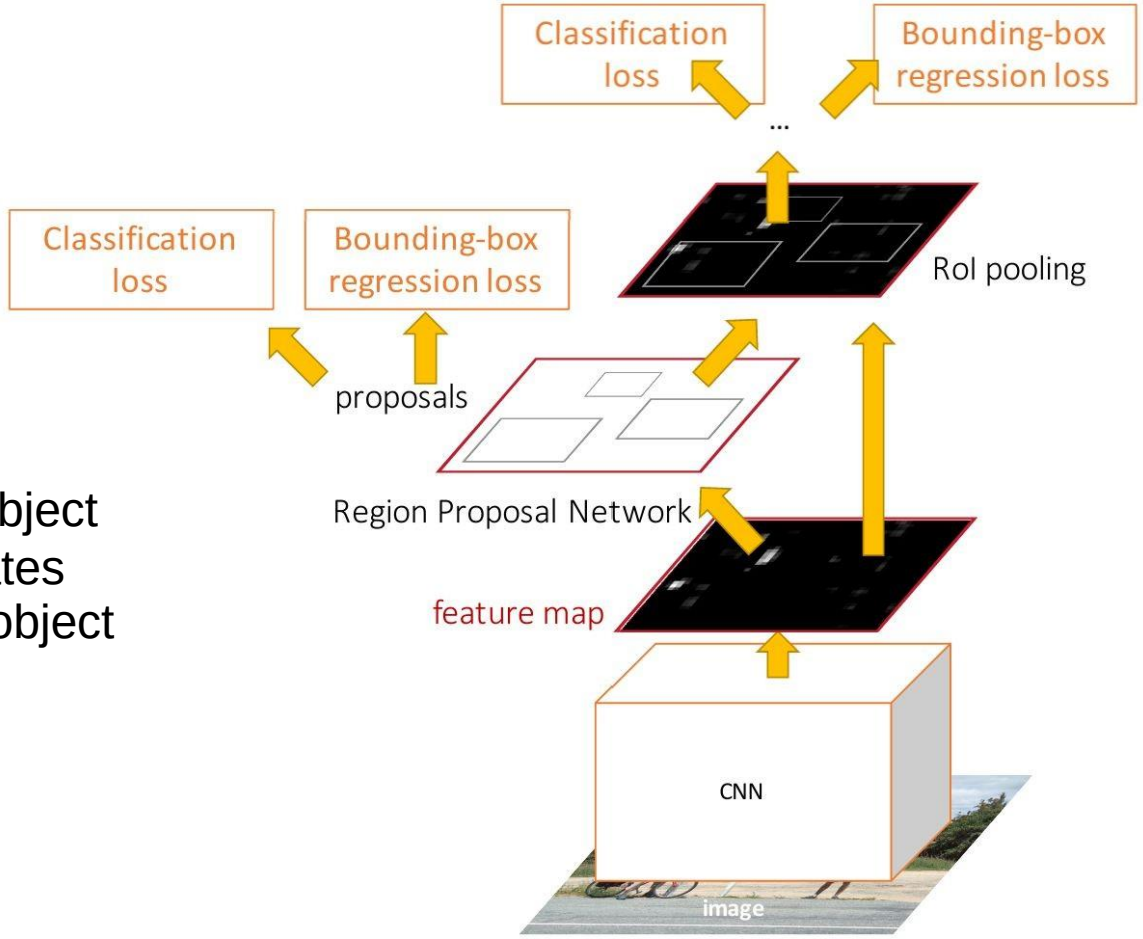
Faster R-CNN

Make CNN do proposals!

Insert **Region Proposal Network (RPN)** to predict proposals from features

Jointly train with 4 losses:

1. RPN classify object / not object
2. RPN regress box coordinates
3. Final classification score (object classes)
4. Final box coordinates



Ren et al, "Faster R-CNN: Towards Real-Time Object Detection with Region Proposal Networks", NIPS 2015

Accurate object detection is slow!

	Pascal 2007 mAP	**Speed**	
DPM v5	33.7	.07 FPS	14 s/img
R-CNN	66.0	.05 FPS	20 s/img

⅓ Mile, 1760 feet

Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

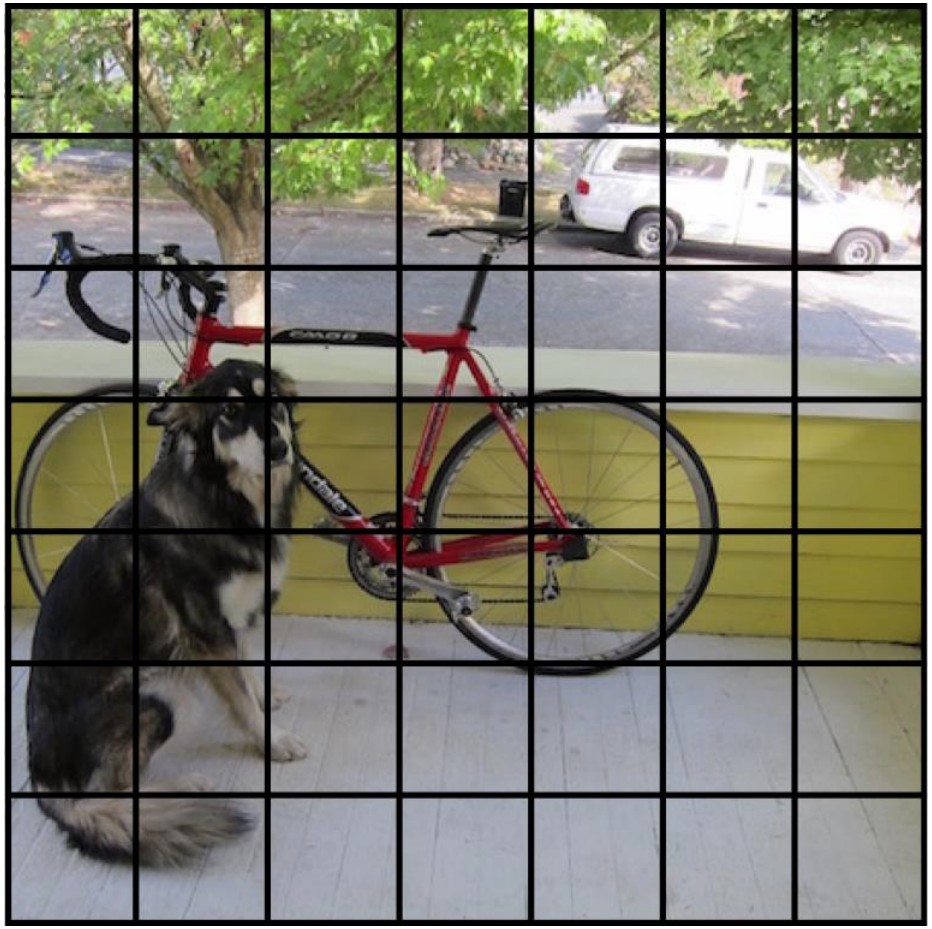
Accurate object detection is slow!

	Pascal 2007 mAP	**Speed**	
DPM v5	33.7	.07 FPS	14 s/img
R-CNN	66.0	.05 FPS	20 s/img
Fast R-CNN	70.0	.5 FPS	2 s/img
Faster R-CNN	73.2	7 FPS	140 ms/img
YOLO	69.0	45 FPS	22 ms/img

2 feet

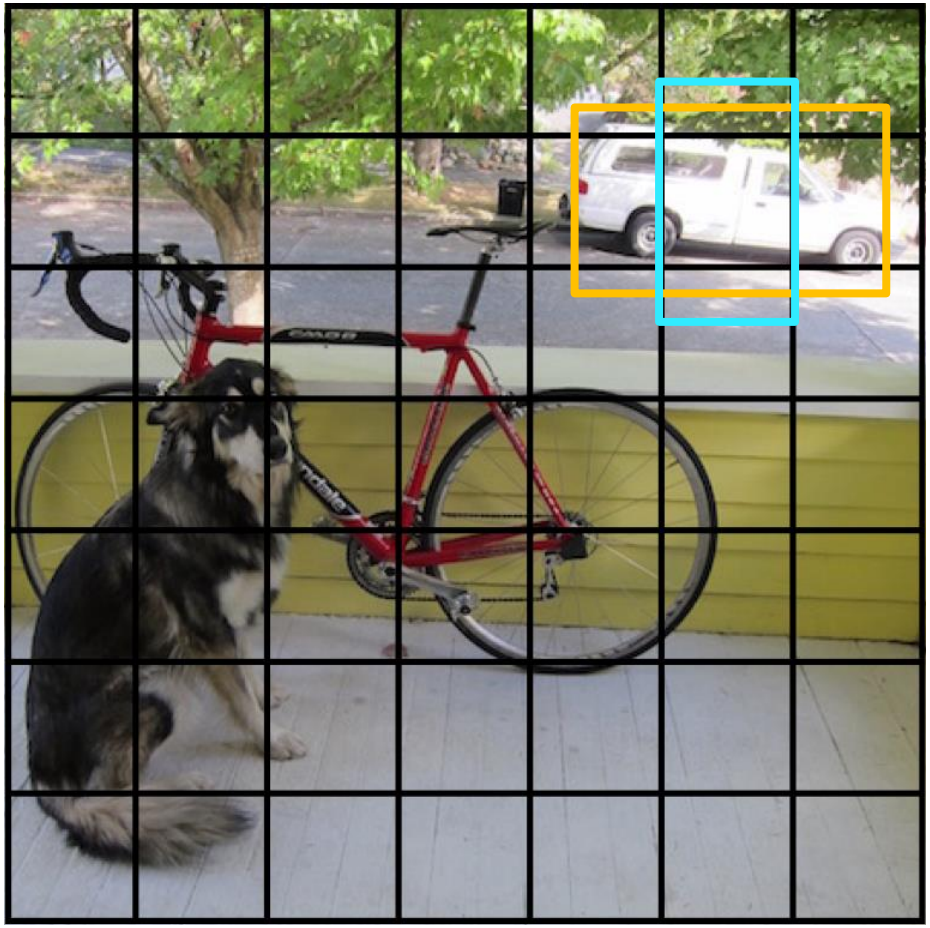
Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

Detection without Proposals: YOLO



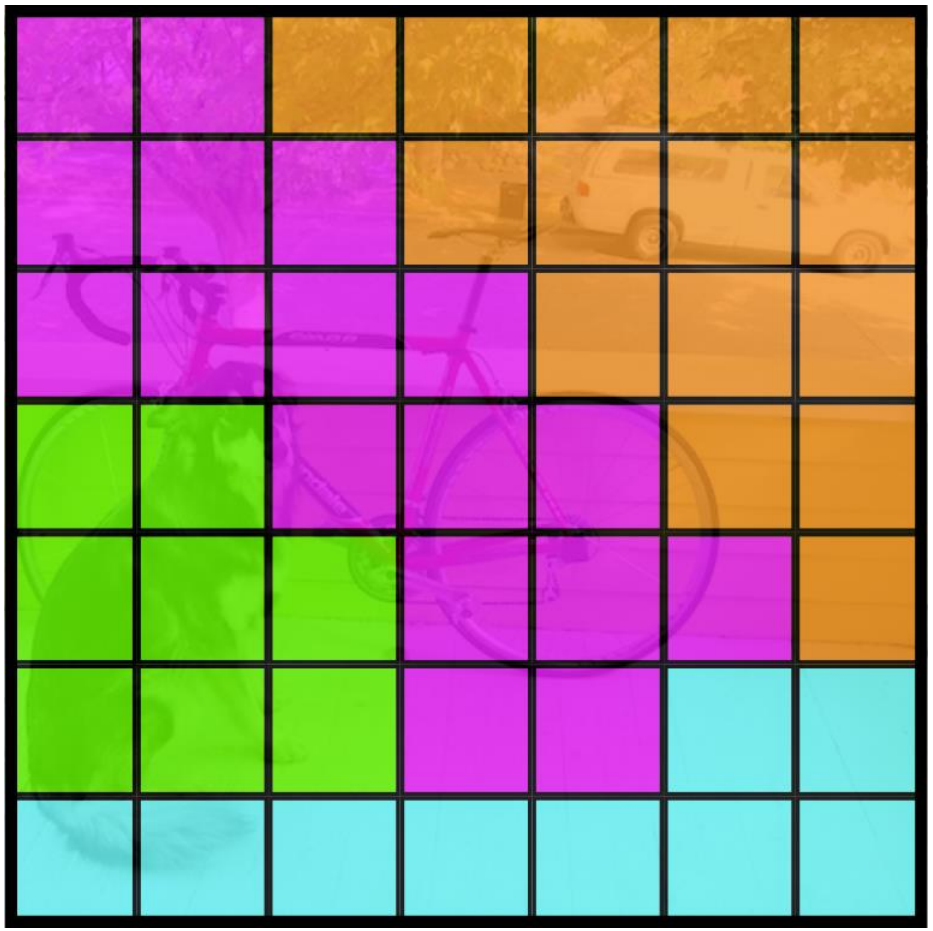
Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

Each cell predicts boxes and confidences: P(Object)



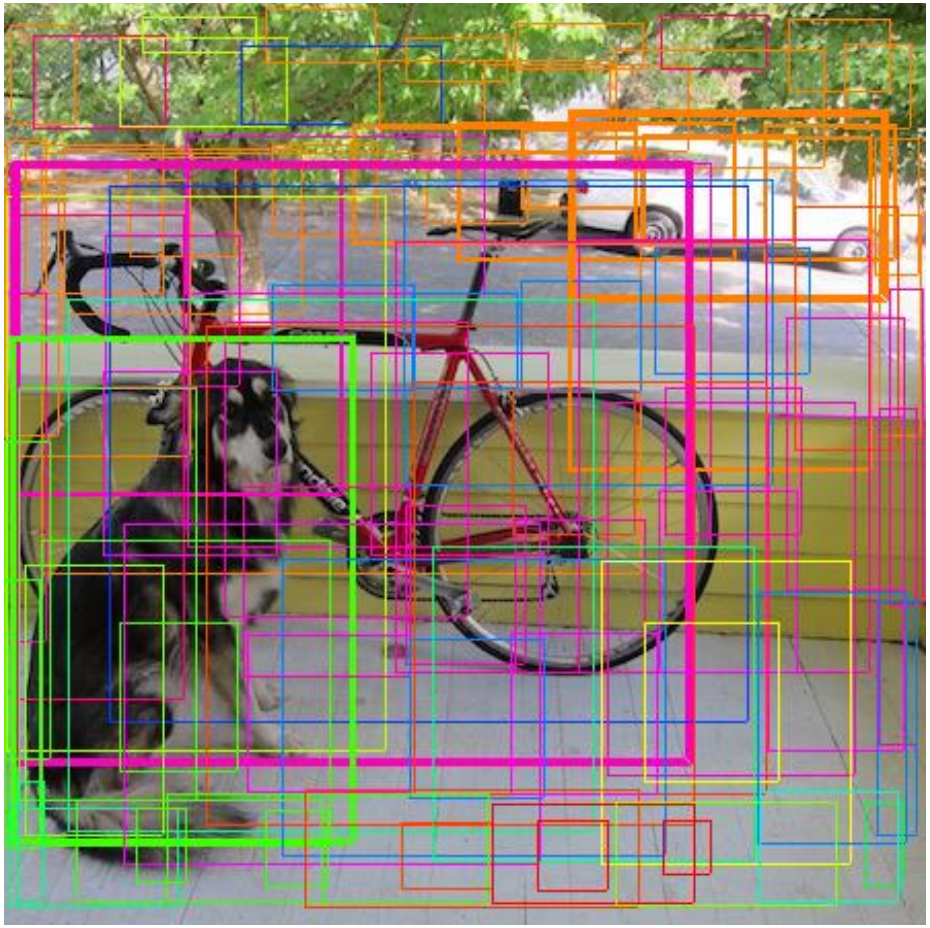
Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

Each cell also predicts a probability P(Class | Object)



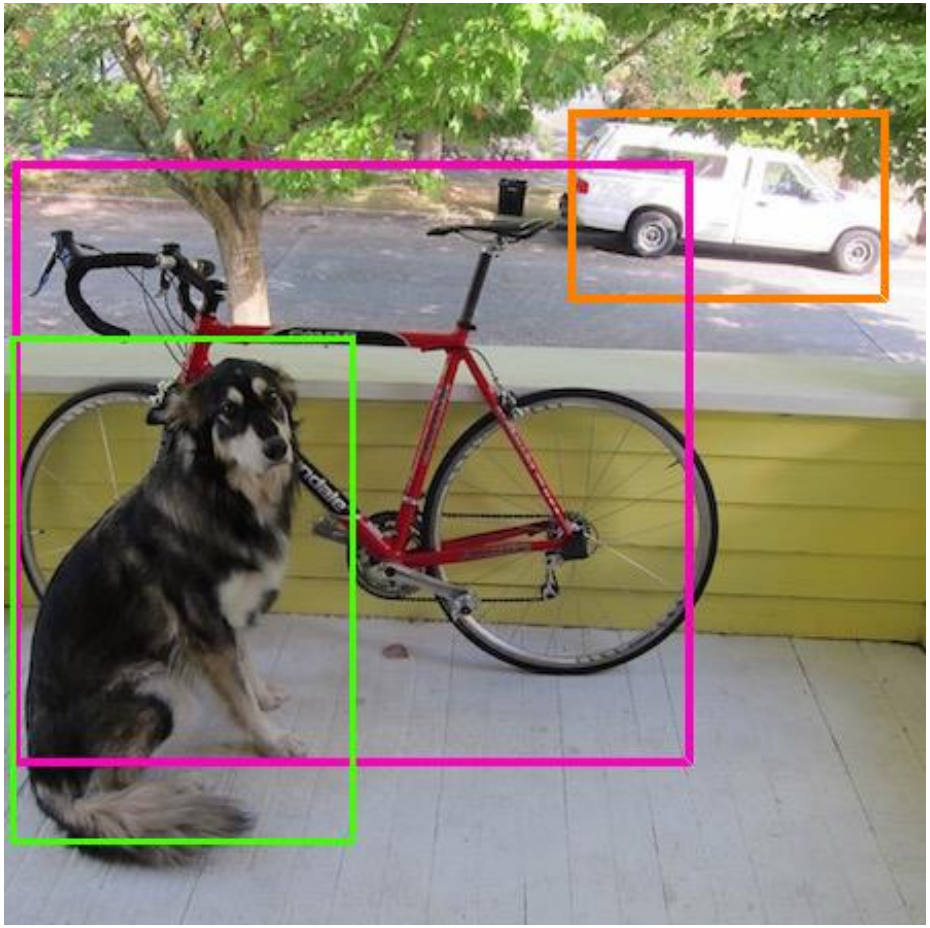
Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

Combine the box and class predictions



Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

Finally do NMS and threshold detections

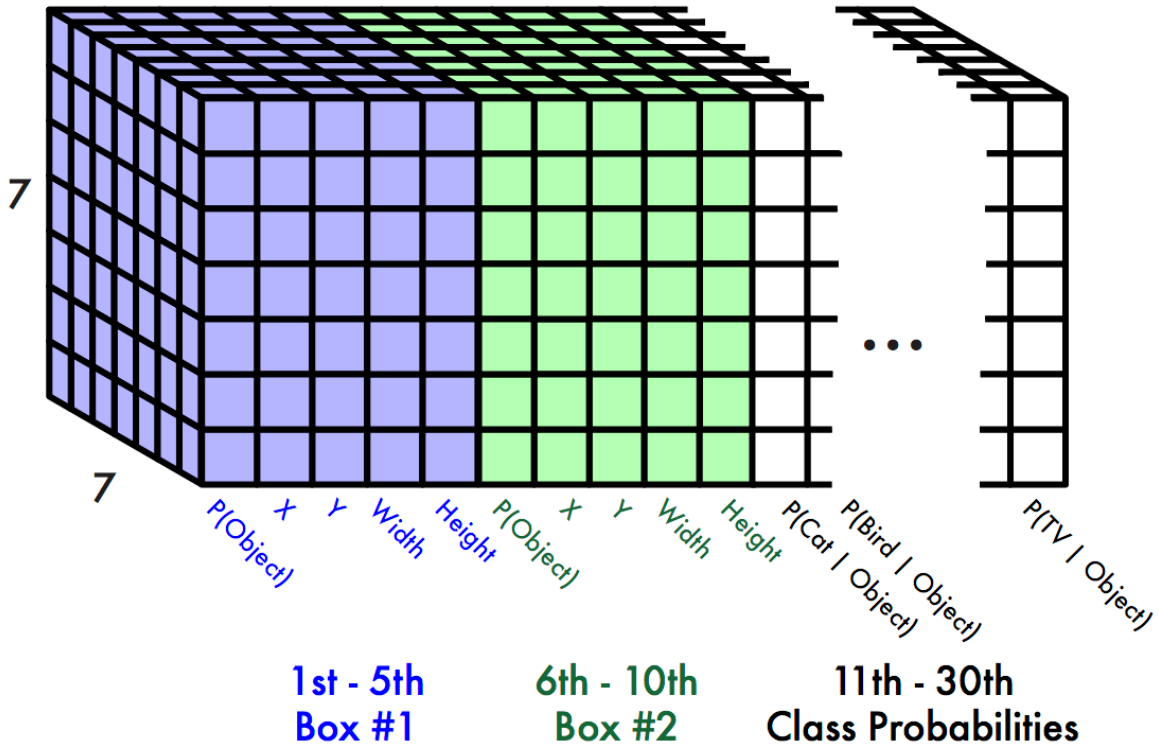


Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

This parameterization fixes the output size

Each cell predicts:

- For each bounding box:
  - 4 coordinates (x, y, w, h)
  - 1 confidence value
- Some number of class probabilities



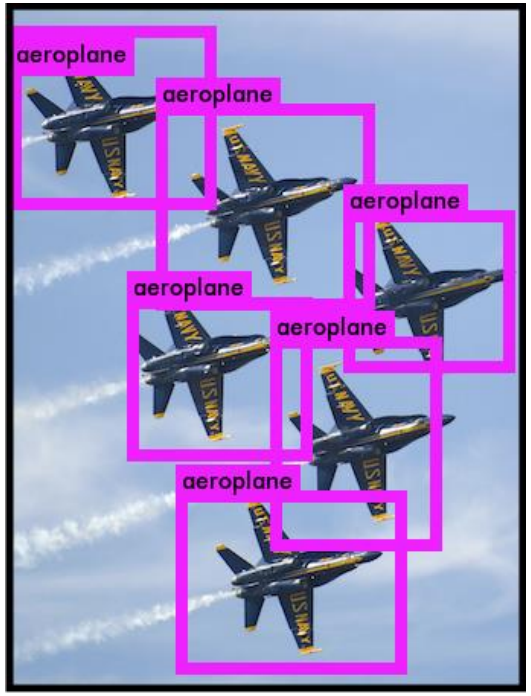
For Pascal VOC:

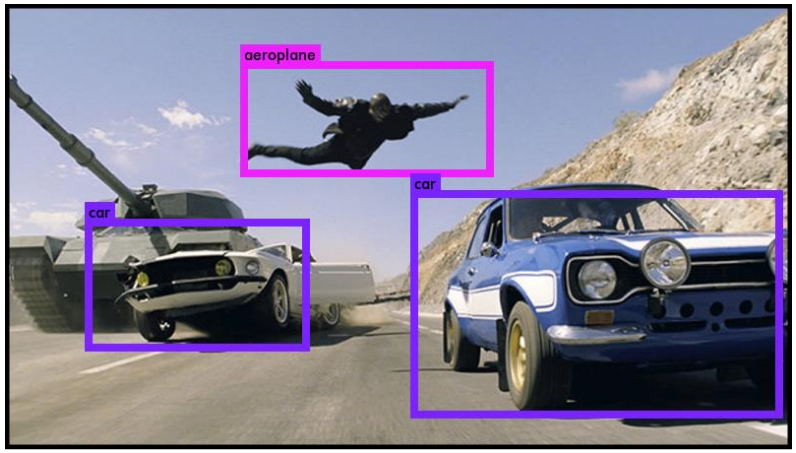
- 7x7 grid
- 2 bounding boxes / cell
- 20 classes

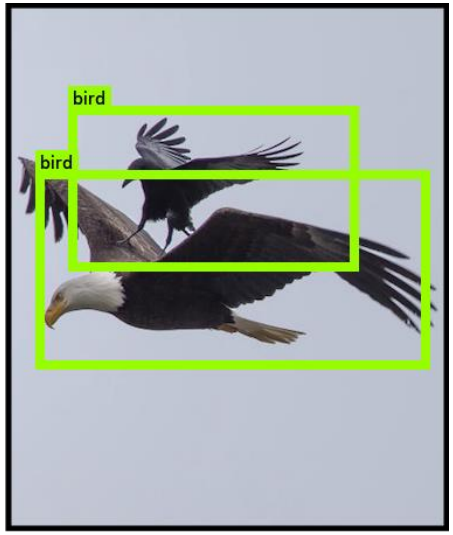
7 x 7 x (2 x 5 + 20) = 7 x 7 x 30 tensor = **1470 outputs**

Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

YOLO works across many natural images







Redmon et al., "You Only Look Once: Unified, Real-Time Object Detection", CVPR 2016

It also generalizes well to new domains
